Higher-Order Logic

Alonzo Church

Peter B. Andrews

- ▶ Church created the simply typed λ -calculus version of higher-order logic in 1940.
- ▶ Andrews pioneered research in automated theorem proving in higher-order logic for many decades. (TPS)

On Connections and Higher-Order Logic

PETER B. ANDREWS

Mathematics Department, Carnegie-Mellon University, Pittsburgh, PA 15213, U.S.A.

(Received: 13 December 1988)

The vpform of this is:

$$\left[\begin{array}{c} \left[\begin{array}{c} P \\ \sim Q \end{array} \right] \vee \left[\begin{array}{c} Q \\ \sim P \end{array} \right] \vee R \\ \\ \sim R \vee \left[\begin{array}{c} \sim P \vee Q \\ \sim Q \vee P \end{array} \right] \\ \\ \left[\begin{array}{c} P \\ \left[\begin{array}{c} Q \\ \sim R \end{array} \right] \vee \left[\begin{array}{c} R \\ \sim Q \end{array} \right] \end{array} \right] \vee \left[\begin{array}{c} \sim Q \vee R \\ \sim R \vee Q \\ \sim P \end{array} \right] \end{array} \right]$$

“vpform” = “vertical path form”

$$\lambda X_{\alpha\alpha\zeta} \lambda Y_{\alpha\beta} \lambda Z_{\alpha} \sim R^1_{\alpha\alpha(\alpha\beta)(\alpha\alpha\zeta)} XYZ$$

$$\lambda X_{\alpha\alpha\zeta} \lambda Y_{\alpha\beta} \lambda Z_{\alpha} \cdot R^2_{\alpha\alpha(\alpha\beta)(\alpha\alpha\zeta)} XYZ \wedge R^3_{\alpha\alpha(\alpha\beta)(\alpha\alpha\zeta)} XYZ$$

$$\lambda X_{\alpha\alpha\zeta} \lambda Y_{\alpha\beta} \lambda Z_{\alpha} \cdot R^4_{\alpha\alpha(\alpha\beta)(\alpha\alpha\zeta)} XYZ \vee R^5_{\alpha\alpha(\alpha\beta)(\alpha\alpha\zeta)} XYZ$$

$$\lambda X_{\alpha\alpha\zeta} \lambda Y_{\alpha\beta} \lambda Z_{\alpha} \exists W_{\varphi} R^6_{\alpha\varphi\alpha(\alpha\beta)(\alpha\alpha\zeta)} XYZ W$$

$$\lambda X_{\alpha\alpha\zeta} \lambda Y_{\alpha\beta} \lambda Z_{\alpha} \forall W_{\varphi} R^7_{\alpha\varphi\alpha(\alpha\beta)(\alpha\alpha\zeta)} XYZ W$$

$$\lambda X_{\alpha\alpha\zeta} \lambda Y_{\alpha\beta} \lambda Z_{\alpha} Y \cdot R^8_{\beta\alpha(\alpha\beta)(\alpha\alpha\zeta)} XYZ$$

$$\lambda X_{\alpha\alpha\zeta} \lambda Y_{\alpha\beta} \lambda Z_{\alpha} X [R^9_{\zeta\alpha(\alpha\beta)(\alpha\alpha\zeta)} XYZ] \cdot R^{10}_{\alpha\alpha(\alpha\beta)(\alpha\alpha\zeta)} XYZ$$

$$\lambda X_{\alpha\alpha\zeta} \lambda Y_{\alpha\beta} X \cdot R^{11}_{\zeta(\alpha\beta)(\alpha\alpha\zeta)} XY$$

Fig. 10.1. Primitive substitutions for $R_{\alpha\alpha(\alpha\beta)(\alpha\alpha\zeta)}$.

Higher-Order Logic

- ▶ Simple Types (no evil type variables)
 - ▶ ι (individuals)
 - ▶ o (propositions/booleans/truth values)
 - ▶ $\alpha \rightarrow \beta$ (function types)
- ▶ Simply typed λ -terms with some logic:
 - ▶ Typed Variables x
 - ▶ Typed Constants c
 - ▶ Applications $s t$
 - ▶ Abstractions $\lambda x.s$
 - ▶ Implications $s \rightarrow t$
 - ▶ Universal quantifiers $\forall x.s$
 - ▶ Optional choice: $\exists x.s$
- ▶ $\beta\eta$ -equivalence (unification is hard)
- ▶ Propositions are terms of type o .
- ▶ Some propositions are provable.
- ▶ Some propositions are valid in all Henkin models.

Main Topic

About 10 years ago I worked on a higher-order theorem prover Satallax. It won the TH0 division of CASC for most years of the 2010s.

- ▶ Complete tableau calculus (in the Hintikka, Beth, Smullyan, Fitting sense) for higher-order logic with a choice operator.
- ▶ Instantiation based – used *no* unification in the basic calculus.
- ▶ Had interesting restriction on quantifiers at base types: only instantiate with *discriminating* terms.
- ▶ Able to reason with equations without rewriting deeply inside terms.
- ▶ People still think I work on this, though I haven't in years.

$$\forall x. f\ x = x$$
$$p\ (f\ (f\ a))$$
$$\neg p\ a$$

Proofgold

Megalodon

Main Topic

- ▶ Lash is a new implementation of Satallax's calculus.
- ▶ Cezary Kaliszyk reimplemented terms/ $\beta\eta$ -normalization in C
- ▶ ...with perfect sharing.
- ▶ He also reimplemented important data structures like priority queues in C.
- ▶ “Better” than Satallax already, but it's still early days.

Georg Cantor

Ernst Zermelo

No one shall expel us from the paradise that Cantor has created. - David Hilbert

Set Theory

- ▶ Popular foundation for mathematics
- ▶ Natural choice for formalizers of mathematics
- ▶ The Mizar people knew this in the 1970s already.
- ▶ ZFC (and TG) are not finitely axiomatizable in first-order
- ▶ ...but higher-order versions are!

Megalodon

Main Topic

Proof Terms

- ▶ λ -calculus / type theory gives a natural notion of proof terms and proof checking.
- ▶ “Curry-Howard”
- ▶ de Bruijn independently knew and implemented this in the late 1960s.

Nicolaas Govert de Bruijn

- ▶ AUTOMATH68 was the first real proof checker.

Higher-Order Logic

Satallax

Lash

Set Theory

Proof Terms

Egal

Proofgold

Megalodon

Main Topic

A simple case is proof terms for (natural deduction proofs) in simple type theory.

Example:

$$\lambda p : o. \lambda u : p. u$$

is a proof of

$$\forall p : o. p \rightarrow p$$

Proof Terms

It's easy to give a calculus for a higher-order set theory with proof terms using only old well-understood ideas.

Set Theory
(Cantor, late 19th century;
Zermelo 1908; Fraenkel 1930s
Tarski 1930s;
Grothendieck 1970s)

Higher-order logic (Church 1940)

Checkable proof terms (de Bruijn 1968)

- ▶ My old interactive prover circa 2013 - 2018 for higher-order set theory with proof terms.
- ▶ For 5 months in 2014 used this to do a bitcoin treasure hunt.
- ▶ I prove a theorem (about basic set theory), use the proof to determine a private key, put some bitcoin at the address and challenged people to rediscover the same proof as me.

- ▶ My old interactive prover circa 2013 - 2018 for higher-order set theory with proof terms.
- ▶ For 5 months in 2014 used this to do a bitcoin treasure hunt.
- ▶ I prove a theorem (about basic set theory), use the proof to determine a private key, put some bitcoin at the address and challenged people to rediscover the same proof as me.
- ▶ Almost *10 people* participated!

This might have been one of them:

Charles Hoskinson (Bitshares, Ethereum,
IOHK/IOG, Cardano)

- ▶ IOHK project (2015-2017): Qeditas
- ▶ Project for a theorem proving blockchain
- ▶ Egal code used for the checker (but with evil polymorphism added!)
- ▶ First person to prove a theorem with *any* correct proof gets the “bounty.”
- ▶ ...never launched?

Proofgold

- ▶ Working extension of Qeditas (but without evil polymorphism) since 2020.
- ▶ A blockchain with a cryptocurrency...
- ▶ but also supports publishing formal math.
- ▶ No email or orcid required!
- ▶ Over 10K published proofs of theorems.
- ▶ So far about 800K Proofgold bars exist (with a cap of about 12M).
- ▶ Almost 300K of these are bounties on theorems.
- ▶ Proofs could be published by anyone, even nonhumans.
