## Two Obstacles to Strong AI/Reasoning for Math

1 Low reasoning power of automated reasoning methods, particularly over large complex theories
2 Lack of computer understanding of current human-level (math and exact science) knowledge

- The two are related: human-level math may require nontrivial reasoning to become fully explained. Fully explained math gives us a lot of data for training AI/TP systems.
- And we want to train AI/TP on human-level proofs too. Thus getting interesting formalization/ATP/learning feedback loops.
- In 2014 we have decided that the AI/TP systems are getting strong enough to try this. And we started to combine them with statistical translation of informal-to-formal math.

## ProofWiki vs Mizar - our CICM'14 Example

Example: Proof Wiki vs Mizar vs Mizar-Style automated proof
$==$ Theorem $==$
Let ( $S, \circ$ ) be an [[Definition:Algebraic Structure|algebraic structure]] that has a [[Definition:Zero Element|zero element]] $z \in S$. Then $z$ is unique. $==$ Proof $==$
Suppose $z_{1}$ and $z_{2}$ are both zeroes of $(S, \circ)$.
Then by the definition of [[Definition:Zero Element|zero element]]:
$z_{2} \circ z_{1}=z_{1}$ by dint of $z_{1}$ being a zero;
$z_{2} \circ z_{1}=z_{2}$ by dint of $z_{2}$ being a zero.
So $z_{1}=z_{2} \circ z_{1}=z_{2}$.
So $z_{1}=z_{2}$ and there is only one zero after all.
\{\{qed\}\}
// NB: Informal proofs are buggy!

Th9: e1 is_a_left_unity_wrt o \&
e2 is_a_right_unity_wrt o implies e1 = e2 proof
assume that A1: e1 is_a_left_unity_wrt o and A2: e2 is_a_right_unity_wrt o;
thus e1 = o. (e1,e2) by A2, Def6 .= e2 by A1, Def5; end;
z1 is_a_unity_wrt o \& z2 is_a_unity_wrt o implies z1 = z2 proof
assume that A1: $z 1$ is_a_unity_wrt o and
A2: z2 is_a_unity_wrt o;
A3: $0 .(z 2, z 1)=z 1$ by Th3,A2; :: [ATP]
A4: $0 .(z 2, z 1)=z 2$ by $\operatorname{Def} 6$,Def $7, A 1, A 3 ;::[A T P]$
hence $z 1=z 2$ by Th9,A1,Def 7,A2; :: [ATP] end;

## Formal, Informal and Semiformal Corpora

- HOL Light and Flyspeck: some 25,000 toplevel theorems
- The Mizar Mathematical Library: some 60,000 toplevel theorems (most of them rather small lemmas), 10,000 definitions
- Coq: several large projects (Feit-Thompson theorem, ...)
- Isabelle, seL4 and the Archive of Formal Proofs
- Arxiv.org: 1M articles collected over some 20 years (not just math)
- Wikipedia: 25,000 articles in 2010 - collected over 10 years only
- Proofwiki - ${ }^{A} T_{E} X$ but very semantic, re-invented the Mizar proof style

## Our Initial Approach/Plan

- There is not yet much aligned informal/formal data
- So try first with "ambiguated" (informalized) formal corpora
- Try first with non black-box architectures such as probabilistic grammars
- Which can be easily enhanced internally by semantic pruning (e.g. type constraints)
- Develop feedback loops between training statistical parsing and theorem proving
- Start employing more sophisticated ML methods
- Progress to more complicated informal corpora/phenomena
- Both directly: ML/ATP with only cruder alignments (theorems, chapters, etc)
- And indirectly: train statistical/precise alignments across informal and formal corpora, use them to enhance our coverage
- Example: word2vec/Glove/neural learning of synonyms over Arxiv

## Work Done So Far: Informalized Flyspeck

- 22000 Flyspeck theorem statements informalized
- 72 overloaded instances like "+" for vector_add
- 108 infix operators
- forget "prefixes" real_, int_, vector_, matrix_, complex_, etc.
- REAL_NEGNEG: $\forall x .--x=x$

```
(Comb (Const "!" (Tyapp "fun" (Tyapp "fun" (Tyapp "real") (Tyapp "bool"))
(Tyapp "bool"))) (Abs "A0" (Tyapp "real") (Comb (Comb (Const "=" (Tyapp "fu
(Tyapp "real") (Tyapp "fun" (Tyapp "real") (Tyapp "bool")))) (Comb (Const
"real_neg" (Tyapp "fun" (Tyapp "real") (Tyapp "real"))) (Comb (Const
"real_neg" (Tyapp "fun" (Tyapp "real") (Tyapp "real"))) (Var "A0" (Tyapp
"real"))))) (Var "A0" (Tyapp "real")))))
```

- becomes

```
(""̈Type bool)" ! (""̈Type (fun real bool))" (Abs (""̈Type real)"
(Var A0)) (""̈(Type bool)" (""̈Type real)" real_neg (""(Type real)"
real_neg ("(Type real)i" (Var A0)))) = (""̈ype real)" (Var A0))))))
```

- Training a probabilistic grammar (context-free, later with deeper context)
- CYK chart parser with semantic pruning (compatible types of variables)
- Using HOL Light and HolyHammer to typecheck and prove the results

Example grammars

## Online parsing system

- "sin ( 0 * x ) = cos pi / 2"
- produces 16 parses
- of which 11 get type-checked by HOL Light as follows
- with all but three being proved by $\mathrm{HOL}(y) \mathrm{Hammer}$

```
sin (&0 * AO) = cos (pi / &2) where A0:real
sin (&0 * AO) = cos pi / &2 where A0:real
sin (&0 * &AO) = cos (pi / &2) where A0:num
sin (&0 * &AO) = cos pi / &2 where A0:num
sin (&(0 * A0)) = cos (pi / &2) where A0:num
sin (&(0 * AO)) = cos pi / &2 where A0:num
Csin (Cx (&O * AO)) = Ccos (Cx (pi / &2)) where A0:real
Csin (Cx (&0) * A0) = coos (Cx (pi / &2)) where A0:real^2
Cx (sin (&0 * AO)) = ccos (Cx (pi / &2)) where A0:real
Csin (Cx (&0 * AO)) = Cx (cos (pi / &2)) where A0:real
csin (Cx (&0) * A0) = Cx (cos (pi / &2)) where A0:real^2
```

## Flyspeck Progress

## Tried Also for Mizar

- More natural-language features than HOL (designed by a linguist)
- Pervasive overloading
- Declarative natural-deduction proof style (re-invented in ProofWiki)
- Adjectives, dependent types, hidden arguments, synonyms
- Addressed by using two layers
- user (pattern) layer - resolves overloading, but no hidden arguments completed, etc.
- semantic (constructor) layer - hidden arguments computed, types resolved, ATP-ready
- connected by ATP or a custom elaborator

## First Mizar Results (100-fold Cross-validation)

## Neural Autoformalization (Wang et al., 2018)

- generate about 1M Latex - Mizar pairs
- Based on Bancerek's work: journal Formalized Mathematics http://fm.mizar.org/
- train neural seq-to-seq translation models (Luong - NMT)
- evaluate on about 100k examples
- many architectures tested, some work much better than others
- very important latest invention: attention in the seq-to-seq models
- more data very important for neural training - our biggest bottleneck (you can help!)

## Neural Autoformalization data

Rendered ${ }^{\text {LAT}} \mathrm{E}_{\mathrm{E}} \mathrm{X}$

$$
\begin{aligned}
& \text { If } X \subseteq Y \subseteq Z \text {, then } X \subseteq Z \\
& X \quad \mathrm{C}=\mathrm{Y} \& \mathrm{Y} \mathrm{C}=\mathrm{Z} \text { implies } \mathrm{X} \quad \mathrm{c}=\mathrm{Z}
\end{aligned}
$$

Mizar

Tokenized Mizar

$$
\mathrm{X} \text { C= Y \& Y C= Z implies X C= Z ; }
$$

LATEX

```
If $X \subseteq Y \subseteq Z$, then $X \subseteq Z$.
```

Tokenized ${ }^{A T} T_{E} X$

```
If $ X \subseteq Y \subseteq Z $ , then $ X \subseteq Z $ .
```

| Union of All 39 Models | 83321 (total) <br> 32083 (no-overlap) | $\begin{aligned} & 79.17 \% \\ & 66.70 \% \end{aligned}$ | $\begin{aligned} & 85.57 \% \\ & 76.39 \% \end{aligned}$ | $\begin{aligned} & 89.73 \% \\ & 82.88 \% \end{aligned}$ |

## Caveat

- Our evaluation is strictly syntactic
- Many synonyms in Mizar:
- for $x$ st $P(x)$ holds $Q(x)$
- for $x$ holds $P(x)$ implies $Q(x)$
- ... and much more semantic ones
- We have not done an ATP evaluation yet

## Neural Autoformalization - Mizar to LaTeX
